

IFQM Employee Ideation Tool

Flows, Process Architecture & Timeline

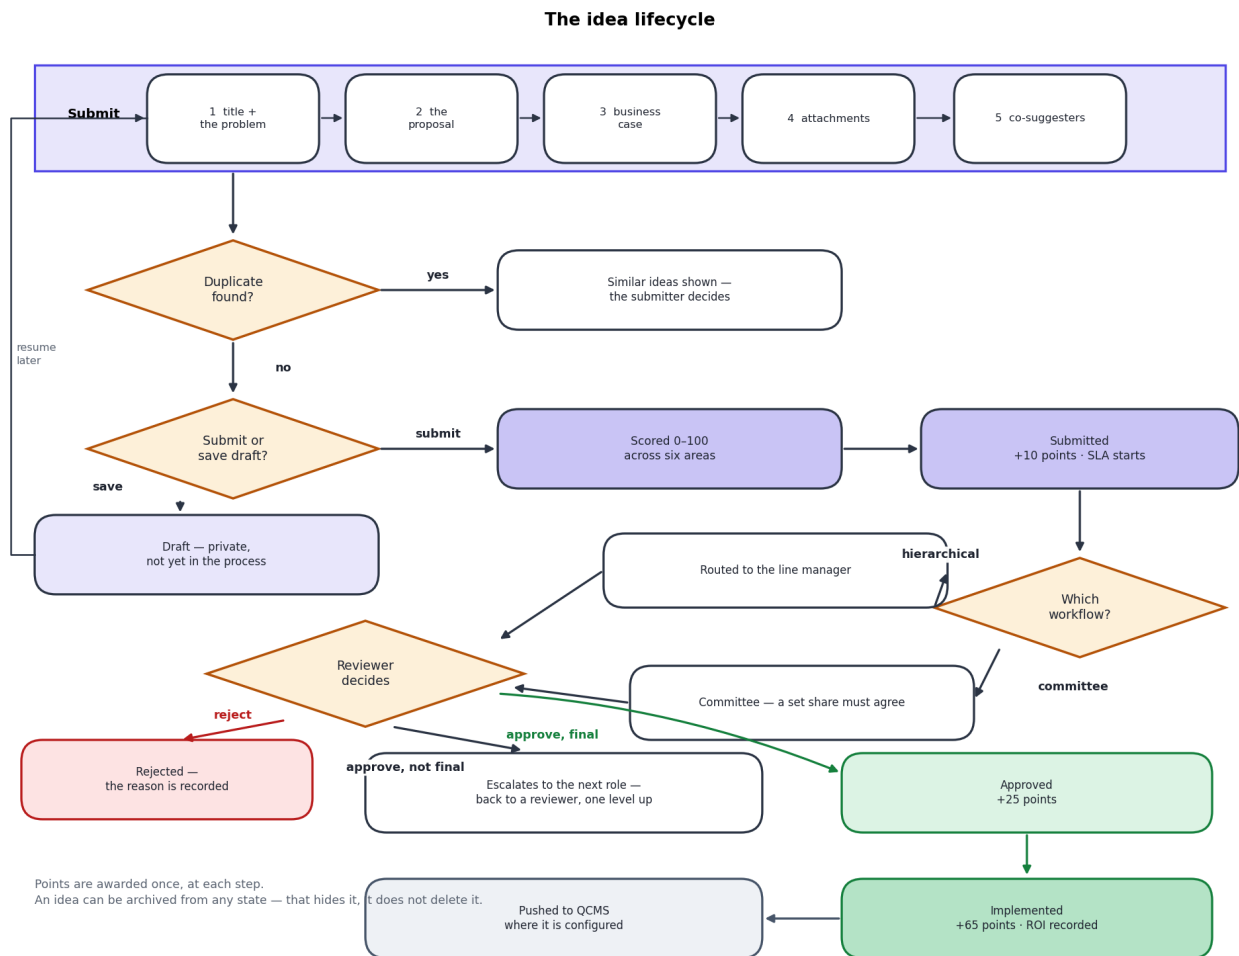

Audience	Anyone needing to understand product behavior - engineers, design reviewers, and IFQM operational staff.
Flow Visuals	Each flow includes detailed flowchart specifications and high-resolution diagrams.
Source Standard	MOM 29 July 2026, Section 2.1 - System Workflow & Process Specifications.

System Overview Flow

1. Idea Lifecycle

The core loop of the system. Everything else exists to move an idea smoothly through this path.

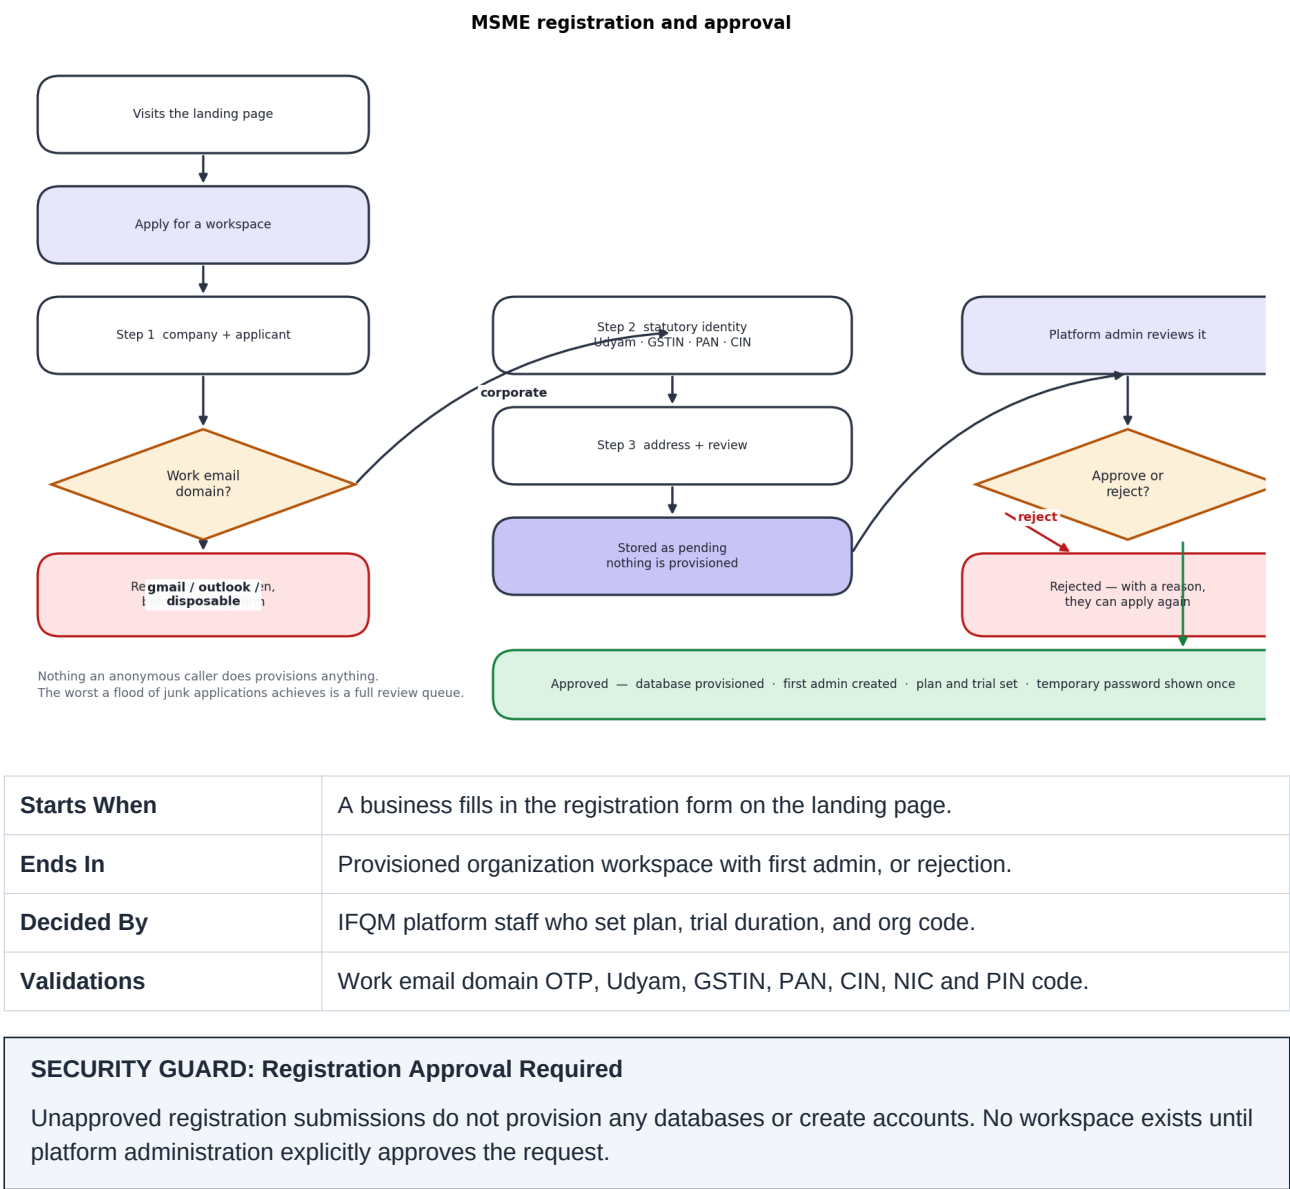

Starts When	An employee opens the Submit page.
Ends In	Implemented & ROI measured, rejected with reason, or saved as draft.
Gamification Points	+10 for submission, +25 upon approval, +65 upon implementation.
Decision Authority	Line manager, or multi-reviewer committee based on org configuration.
Key SLA Settings	review_sla_days (overdue alert), escalation_days (chain escalation).

IMPORTANT: Overdue vs Escalated Ideas

review_sla_days marks an idea as late so a reviewer is reminded - nothing reassigns automatically. escalation_days is what actually advances the proposal to the next role in the chain.

2. MSME Registration and Approval

How an organization requests a workspace and how platform administrators verify and provision tenants.

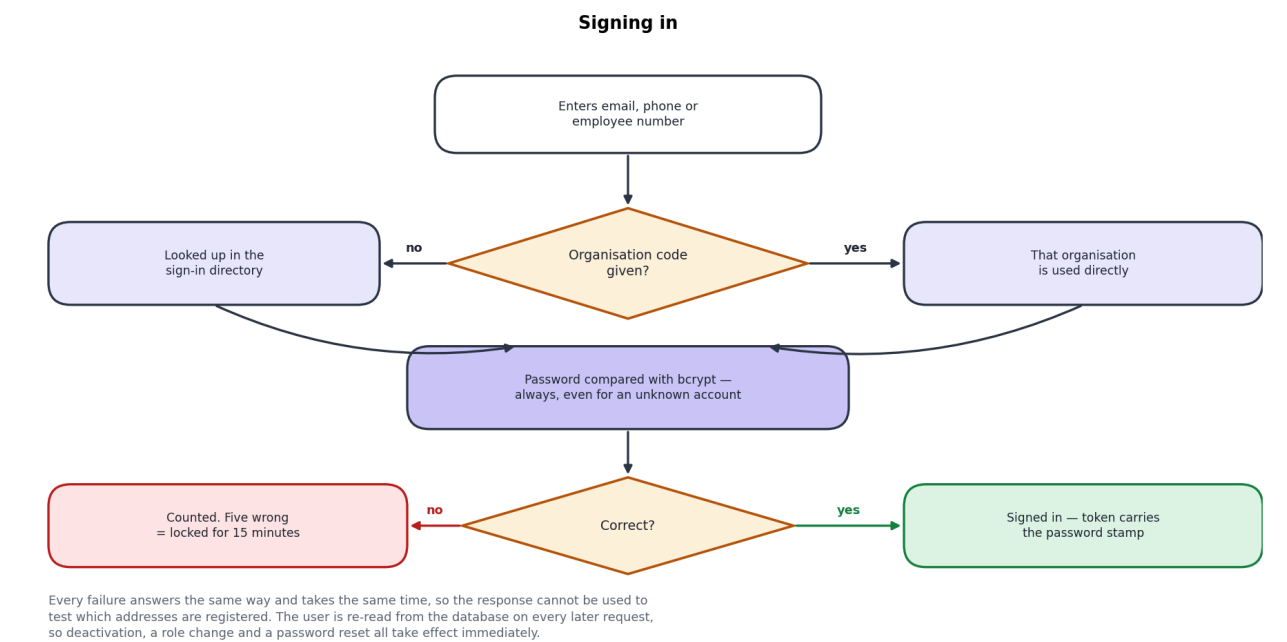

Starts When	A business fills in the registration form on the landing page.
Ends In	Provisioned organization workspace with first admin, or rejection.
Decided By	IFQM platform staff who set plan, trial duration, and org code.
Validations	Work email domain OTP, Udyam, GSTIN, PAN, CIN, NIC and PIN code.

SECURITY GUARD: Registration Approval Required

Unapproved registration submissions do not provision any databases or create accounts. No workspace exists until platform administration explicitly approves the request.

3. Authentication & Security

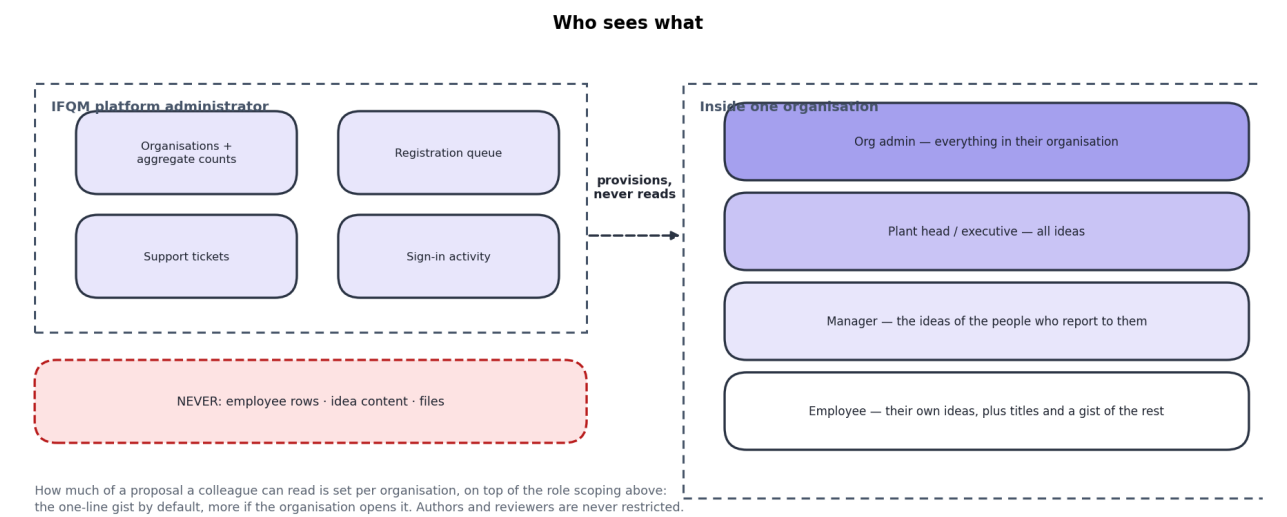

Multi-tenant authentication flow, email OTP login, lockout protection, and JWT session handling.

Sign In Credentials	Corporate email, registered phone number, or employee ID.
Org Resolution	Optional - sign-in directory resolves tenant automatically if omitted.
Lockout Guard	5 consecutive failures trigger a strict 15-minute security lock.
Session Security	Stateless JWT token containing password change timestamp stamp.

4. Who Sees What (Role Visibility Matrix)

Privacy boundary scoping defining visibility across roles and platform staff.

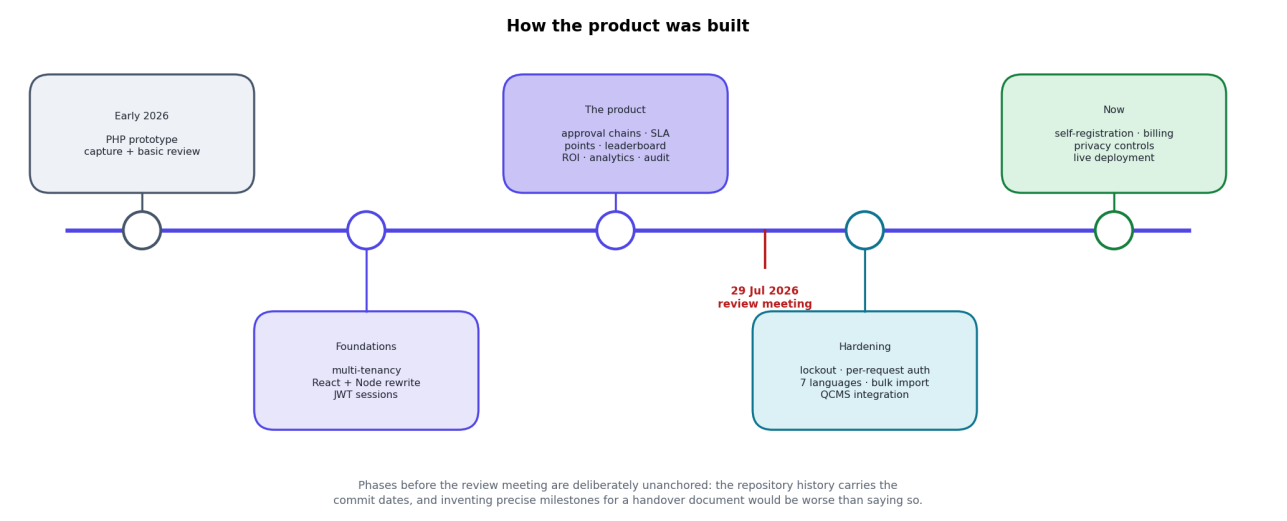

Role	Visibility Scope
Employee	Own ideas in full. Public/All Ideas board shows title, status, and configured summary.

Line Manager	Ideas submitted by employees reporting to them in organizational hierarchy.
Plant Head / Exec	All ideas within their organization across all departments.
Org Admin	Full organization data, user management, and system settings.
Platform Admin	Aggregate metrics, tenant lists, registration queue, support tickets. STRICT ZERO-ACCESS to tenant idea content or employee records.

5. Product Development Timeline

Chronological progression of features and technical architecture.

Phase	Milestones Built
Phase 1	PHP Prototype: core idea capture, basic review workflow.
Phase 2	Multi-Tenancy Architecture: database isolation & master registry.
Phase 3	React + Express Re-architecture: stateless JWT authentication & UI redesign.
Phase 4	Approval Chains & Gamification: Plant Head reviewer, SLA clock, points & leaderboards.
Phase 5	Enterprise Integrations & Multi-Language: 7-language i18n, bulk import & QCMS integration.
Phase 6	MSME Self-Registration & OTP: ZeptoMail email OTP, subscription plans & dedicated reset flow.
