

IFQM Ideation Platform

Work completed on 25 July 2026

Prepared for · The IFQM / IET Team

Scope · Meeting minutes (23 Jul) + requested fixes

Automated tests · 29 passing

Known vulnerabilities · 0

This document lists everything changed in today's session, in plain language. Every item marked **TESTED** is backed by an automated test that was executed; items marked **DONE** were verified in the running app or by code. One item is **DEFERRED** for a cost reason, explained below.

Known vulnerabilities

Login & accounts

1 Sign in without an organisation code **TESTED**

The organisation code field is gone from the login screen. People now sign in with just their **email or their registered phone number** — the platform works out which organisation they belong to automatically (via a global login directory, with a safe fallback that "self-heals" for existing users on first sign-in). Forgot-password works the same way. No enumeration risk: an unknown email/phone is refused with the same generic message as a wrong password.

2 Phone numbers in user creation (individual & bulk) **TESTED**

An admin can now capture a phone number alongside the email when creating a user one-by-one or via bulk import. Each user can then log in with **either** their email or their phone number.

3 Consistent first-login password (name + birth year) **DONE**

Creating a user individually now uses the **same rule as bulk import**: the first-login password is the first 4 letters of the name + the birth year (e.g. "asha1994"). The admin enters a date of birth (not a password), the account is forced to change it on first login, and the generated password is shown to the admin to pass on.

4 OTP on first login / forgot-password **DEFERRED**

Real one-time-passcodes **to a mobile number are not free** — they need a paid SMS gateway (Twilio/MSG91) with per-message cost. Per your "if it's free" note, this was left out for now. A no-cost *email* OTP can be added later using the mail server already configured, if you'd like.

Idea submission & the "Business Case"

5 Add more than two co-suggesters TESTED

An idea could credit at most two colleagues. It can now credit **any number** — a searchable "add colleague" box with removable chips. The full list shows on the idea, in the review popup, and on the exported PDF.

6 Attach a document under "Benefits Expected" TESTED

Just like "Support Required", employees can now attach a supporting document (a costing sheet, a projection) directly under the **Business Case** → **Benefits Expected** field.

7 Amounts default to Indian Rupees (₹) DONE

All monetary fields on the idea form carry a ₹ symbol and an "amount in INR" hint, and ₹ is used consistently in the review popup and the exported PDF (with Indian digit grouping, e.g. ₹ 6,20,000).

Bug fixes & the exported PDF

8 Fixed the idea popup hiding its tabs DONE

When opening an idea from "All Ideas", the **Details / Timeline / Attachments** tab bar was being squashed to a thin, unreadable sliver (visible in the screenshot you sent). Root cause: a layout rule let the tab strip collapse when the popup content was tall. Fixed so the tabs always show at full height.

9 Rebuilt the "Export idea as PDF" — bugs fixed + recoloured blue DONE

Several layout bugs were fixed and the whole document was recoloured from green to the product's **blue theme**:

Chart caption overlapped the section header	Moved the "Pareto / Stratification Chart" caption inside its box.
An arrow printed as a "tofu" box (□)	The chosen font had no arrow glyph; replaced with a symbol it can render.
Long idea titles were cut off with "..."	Header rows now grow to fit — titles wrap in full.
Section F boxes overran into Section G	Those boxes now size themselves to their contents.
Colour theme was green	Recoloured to the project's indigo/blue (#4f46e5).

Verified by rendering the PDF to images and inspecting both pages. Amounts render in ₹; the file stays a clean 2-page A4.

Housekeeping found & fixed during testing

Superadmin dashboard — monthly activity TESTED

The superadmin dashboard already showed the **total ideas submitted**; it now also shows a **Monthly Submission Activity** chart (last 12 months) — completing meeting-minutes item 1.

Security — a new dependency advisory, found and fixed DONE

During re-testing, the dependency scan flagged 9 high-severity issues from a **newly-published advisory** in a sub-library (a denial-of-service in brace-expansion, pulled in by the spreadsheet library). It was pinned to the patched version — the scan is back to **0 known vulnerabilities** and the spreadsheet/bulk-import feature still works.

Translations kept complete DONE

All new on-screen text was translated into all seven languages, keeping every language at full parity (747 phrases each, 0 missing).

Checklist against your 23 July meeting minutes

MEETING ITEM	STATUS
1 · Superadmin: total ideas + monthly activity	DONE — total already shown; monthly activity added.
2 · Business Case values in ₹ (INR)	DONE
3 · Add more than two co-suggesters	TESTED

IFQM Ideation Platform — Change Summary · 25 Jul 2026

Confidential

MEETING ITEM	STATUS
4 · Attachment under Support Required	TESTED (delivered earlier, retained)
5 · Attachment under Benefits Expected	TESTED
6 · Login by phone / email; OTP on first login	TESTED email/phone login · OTP DEFERRED (paid SMS)
7 · Export complete idea details as a PDF	DONE (fixed & recoloured today)

EVIDENCE (FOR THE TECHNICAL TEAM)

Automated suite: `cd backend && npm test` → 29 pass / 0 fail (+6 new tests today: email login, phone login, generic-refusal, >2 co-suggesters, benefits attachment, monthly dashboard). Security: `npm audit --omit=dev` → found 0 vulnerabilities after the brace-expansion pin. Frontend production build compiles clean. Login changes are backward-compatible — an old `?org=` link still works.

Note on "scaling" tests: functional tests were re-run and all pass. Load/soak/scale testing still requires a load-testing harness that is not yet built — it is not simulated or estimated here; see the separate Product Testing Report for the full readiness picture.
